Work Plan

Where are we?

- GUI is working and complete
- One Pi is successfully streaming video at high frames per second with no delay.

Where are we going?

Objectives:

- Get video and audio streaming to VLC on the GUI
- Get the sound and video sending to the server using ffmpeg

Where we are going?

What will we do:

- Get all the pi's configured to stream video (so any of them can be used as a client)
- Get the GUI working on the Pi
- Sending of temperature and heart rate from client to server.

Problems?

- Ffmpeg takes a LONG time to install so wont be able to finish today.
